

- Let us store our data in a DB instead of file!
- We will add simple administration tool for the admin to view and edit the info of registered users as the following:

- The administrator is an authenticated user, so he/she will login first to go to administration panel.
- The administrator will view all users in the system; he can edit the user information, or delete the user but not his entity!
- He/She has the ability to add new user to the system.
- During Registration please validate the mail against REGEX!
